BATTERY APPLICATION GUIDE 2020

AUTOMOTIVE | LAWN & GARDEN | POWERSPORT

ISSUE DATE: 05/20

BI-MART

TABLE OF CONTENTS

How to Use This Catalog	II
Battery Specifications	III—IV
BCI Assembly Figures, Cell Layout, and Terminals	V
BCI/DIN/EN Reference Chart	VI
Group Size Cross Reference Chart	VII
Checking Battery Condition	VIII
Instructions for Charging a Battery	IX
Special Charging Instructions for AGM and Gel Batteries	IX
Battery Recharging Time Chart	X
Battery Terms You Should Know	XI
Battery Best Practices	XII
Warnings and Abbreviations	XIII

APPLICATIONS

Passenger Cars, Light Trucks, and Vans	1—156
Lawn and Garden	157—186
Motorcycle and Scooter	187—202
ATV	203—207
PWC	208—209
Snowmobile	210—213
Utility Vehicles	214

HOW TO USE THIS CATALOG

Step 1: Find your vehicle's make, model, engine, year.

Example: Make: Chevrolet Model: Silverado 1500 Engine: V8 6.2L Year: 2015

		MAKE,MODEL,ENGINE,YEAR	O.E. GRP	O.E. CCA/AH	BI-MART PREMIUM	BI-MART 75DT	BI-MART 78DT
MAKE		CHEVROLET					
	MODEL	SILVERADO 1500					
ENGINE		V8 6.0L					
	YEAR	2013-2008 Optional	48	730CCA	---	---	---
		2012-2008	48	615CCA	L3/48P	---	---
		2007 Early	78	600CCA	78P	---	78DTP
		2007 Late	48	615CCA	L3/48P	---	---
		2006-2003	78	600CCA	78P	---	78DTP
		2005-2003 Optional	78	770CCA	---	---	78DTP
		V8 6.2L					
		2020 Auxiliary	48	730CCA	---	---	---
		2018-2014	94R	720CCA	L4/94RP	---	---
		2018-2014 Auxiliary	48	730CCA	---	---	---
		2013-2009	48	615CCA	L3/48P	---	---
		2013-2009 Optional	48	730CCA	---	---	---

Step 2: Determine the best battery for you.

		MAKE,MODEL,ENGINE,YEAR	O.E. GRP	O.E. CCA/AH	BI-MART PREMIUM	BI-MART 75DT	BI-MART 78DT
		CHEVROLET

CAUTION: These are common holddown types but others may be used.

Holddown descriptions:

B1 = 10.5 mm high with 3 or 5 notches on sides only

B3 = 10.5 mm high on sides with 3 or 5 notches on sides and 3 notches on ends.

B4 = 19.0 mm high on sides only with 3 or 5 notches on sides only

B1
Base hold-down 10.5 mm (on long sides)

B3
Base hold-down 10.5 mm (on long and short sides)

B4
Base hold-down 19 mm (on long sides)

CHECKING BATTERY CONDITION

Periodically, you may be asked to inspect batteries and determine their condition. The owner may be seeking advice on whether or not to replace the battery, or may be seeking replacement under warranty terms if he judges failure to have been premature.

You must consider several aspects of customer behavior, and your reputation may depend upon how you deal with them. If you send the customer away with a battery which is marginal in condition you may be committing him/her to a tow or an emergency jump start which might cost nearly as much as a new battery. If you replace batteries under warranty terms without question, you may simply be condemning the new battery to a short life under abusive service conditions which should be corrected. Your customer deserves better.

First, examine the battery externally. Any which have cracks or holes in container, cover or vents, through which electrolyte will leak, should be recommended for replacement. The cost of replacing other components, if they have been damaged by electrolyte corrosion, could be alarmingly high and accidental injuries could ensue. Filthy batteries, wet with spewed electrolyte caused by over-topping with water, with corroded terminal posts or with low electrolyte levels indicate neglect and abuse in service. Whatever replacement action you decide to take, advise the customer on the value of improving service conditions.

Next, measure the indicated state-of-charge on the battery by means of electrolyte-specific gravity readings in each cell and by open-circuit voltage across the terminals. If the battery has non-removable vent caps, only open-circuit voltage readings can be used.

Determining State of Charge	
12.75 and above	100% charged
12.60-12.74	85-100% charged
12.40-12.59	75-85% charged
12.20-12.39	50-75% charged
12.00-12.19	25-50% charged
12.00 and below	Fully discharged

Note: The state of charge listed is an approximation. The relationship between state of charge and voltage varies by CCA rating and case size.

If batteries have been receiving a charge current within the previous few hours, the open-circuit voltage may read misleadingly high. Prior to checking voltage after charging, let battery rest 4 hours in order to eliminate an inaccurate reading. Odd cells which show specific gravity readings .050 lower than other cells are probably internally short-circuited. Such batteries should be replaced. Batteries which are at less than 75% state-of-charge need recharging before proceeding with any further tests.

Observe that the battery does accept a charging current, even though it may be small in amperes, when the charger is switched on. See the notes on charging.

If the state-of-charge is 75% or higher, the battery should be given a high-rate load test. Typically, the high-rate load tester will discharge a battery through an adjustable carbon-pile resistance and indicate the terminal voltage as the discharge proceeds. After 15 seconds the battery voltage will not drop below a specified value if the battery is in good condition and if the current is set at about 50% of the Cold Cranking Amps (CCA). The minimum acceptable voltage reading will vary as battery temperature decreases. Read and follow the manufacturer's instructions for the tester. Alternatively a conductance or impedance tester can be used to verify battery condition. When using these testers, directions to identify "Good", "Bad," or "Recharge and Retest" should be followed. Some of these testers also estimate a CCA rating which are generally not useful for verifying battery condition. Read and follow the manufacturer's instructions for conductance or impedance testers.

Batteries that have low but uniform specific gravities in each cell and which clearly require an extended recharge may have become deeply discharged through accidentally leaving a car door open overnight. It may also be the result of undercharging caused by regular driving in heavy traffic or by a fault in the vehicle charging system. This may be nothing more than a slack alternator/generator drive belt, but the system should be checked out before the battery is returned to service.

INSTRUCTIONS FOR CHARGING A BATTERY

The room or compartment in which the battery is being charged should be well ventilated. Do not put a battery on charge unless you are wearing safety goggles and a face shield. It must be assumed that explosive mixtures of hydrogen gas are present within the battery cells at all times. Even a battery standing idle generates small quantities of hydrogen due to the self-discharge action. This gas collects in the cells and can be exploded by a torch, match flame, lighted cigarette, sparks from loose connections or metal tools making contact between the terminals and the ungrounded terminal and adjacent metal parts which are grounded.

Since vent cap designs having flame barrier features are not easily distinguished from other style vent caps, it is recommended that vent caps be left on the battery during charging. As a further precaution, place a wet cloth over the battery and vent caps. Since flame arresters are used in most modern vent caps designs to reduce the possibility of the battery being exploded by an external spark, this safety feature could be bypassed by removal of the vent caps. Whether such vent caps are present or not, always shield eyes when working around the battery and follow the precautions covered here.

Do not charge a battery unless you are thoroughly familiar with the step-by-step procedure to use. Follow the manufacturer's instructions on the charger. If the instructions are no longer legible and you do not have literature containing the instructions, then obtain the instructions from the manufacturer of the charger. Never use a charger without instructions. Turn the charge rate switch and timer to the "OFF" position before connecting the leads to the battery. Next, connect the charger leads to the battery terminals, red positive (+) lead to positive terminal and black negative (-) lead to negative terminal. If the battery is in the car, connect the negative lead to the engine block if the car has a negative ground (negative battery terminal is connected to ground). Connect the positive lead to ground if the car has a "positive ground" (now rarely occurs). "Rock" the charger lead clamps to make certain a good connection has been made. Set the electric timer to the desired charging time. Now, turn on the charger and slowly increase the charging rate until the desired ampere value is reached. Do not charge in the red zone. If smoke or dense vapor comes from the battery, shut off the charger and reject the battery. If violent gassing or spewing of electrolyte occurs, reduce or temporarily halt the charging.

Never touch the charger leads when the charger is "ON". This could break a connection at the battery terminal, creating a spark which could ignite the explosive gases in the battery. Never break a "live" circuit at the battery terminals for the same reason. Always turn the charger "off" before removing a charger lead from the battery.

When charging or testing a side terminal battery out of a vehicle, always use side terminal charging and testing posts which have been designed for this purpose.

SPECIAL CHARGING INSTRUCTIONS FOR AGM AND GEL BATTERIES

Constant-Voltage Method (Recommended Method)

AGM and gel batteries are sensitive to high voltage charging (above 14.4 volts). The recommendation is to use a 6- to 12-amp, 12-volt automatic charger set at the regular setting. If you use a non-automatic charger, you need to monitor the voltage so it does not exceed 14.4 volts and/or 12 amps at any time during recharge. This battery needs recharging only if the open-circuit voltage (O.C.V.) is below 12.5 volts. **DO NOT OVERCHARGE.**

BATTERY RECHARGING TIME CHART

(O.C.V.) OPEN CIRCUIT VOLTAGE	CCA	5 AMP CHARGE RATE (IN HOURS)	10 AMP CHARGE RATE (IN HOURS)	20 AMP CHARGE RATE (IN HOURS)
BELOW 11.85	200-300	8	4	2

	901-1000	6.5	5.5	2.2

If battery has less than 75% state of charge, it must be recharged before any further testing.

The rate at which battery should be charged depends on:

- Capacity of battery
- State of charge

The capacity of battery can be determined one of two ways:

- Reserve Capacity rating (RC)
- Cold Cranking Amps rating (CCA)

BATTERY TERMS YOU SHOULD KNOW

ABSORBED GLASS MAT (AGM) -

A highly porous fiberglass mat separator which functions as an electrolyte retainer, somewhat like a sponge. Usually found in premium, specialized batteries like Valve-Regulated Lead-Acid (VRLA) battery types. This technology provides the highest oxygen recombination efficiency and improves the high-rate discharge performance.

AMPERE (AMP) -

The unit of measure of current flow through a conductor or circuit.

CAPACITY -

The ability of a fully charged battery to deliver a specified quantity of electricity at a given rate (AMPERES) over a definite period of time. Battery capacity depends on construction, materials used, size, weight, discharge rate, temperature, resistance and age.

CIRCUIT -

An electric circuit is the path of an electric current. A closed circuit has a complete path. An open circuit has a broken or disconnected path.

CIRCUIT (SERIES) - A circuit which has only one path for the current to flow. Batteries arranged in series are connected as shown below. If two 12 volt batteries are connected in a series, the circuit voltage is equal to the sum voltage of each battery, or 24 volts.

CIRCUIT (PARALLEL) - A circuit which provides more than one path for current flow. Batteries arranged in parallel are connected as shown below. If two 12 volt batteries are connected in parallel, the circuit voltage is still 12 volts and the total battery capacity will double.

DUAL VOLTAGE (SERIES/PARALLEL) - A circuit which applies additional voltage to either the starting or electronic systems. Batteries arranged in a dual voltage system are connected as shown below. If two 12 volt batteries are connected in a dual voltage system, one portion of the system will receive 12 volt and the other will receive 24 volts.

CORROSION -

An accumulation of solid sulfates of iron, copper or other metals, usually in the terminal area, contributing to poor electrical contact between cables and battery terminals.

COLD CRANKING AMP RATING -

The number of amperes a battery at 0° F can deliver for 30 seconds and maintain a voltage of 1.2 volts per cell or higher.

CRANKING AMP RATING -

The number of amperes a battery at 32° F can deliver for 30 seconds and maintain a voltage of 1.2 volts per cell or higher.

CURRENT -

The rate of flow of electricity. The movement of electrons along a conductor. It is comparable to the flow of a stream of water.

CURRENT (ALTERNATING) -

A current that varies periodically in magnitude and direction.

CURRENT (DIRECT) -

An electrical current flowing in one direction only. A battery delivers direct current (D.C.) and must be recharged with direct current.

CYCLE -

In a battery, a discharge and a recharge is a cycle.

DISCHARGING -

When a battery is delivering power, it is said to be discharging.

ENHANCED FLOODED BATTERY (EFB) -

A flooded lead acid battery with enhanced cycling capability and charge recovery compared to standard flooded starter batteries.

ELECTROLYTE -

This is a mixture of water and sulfuric acid that fills a lead-acid battery and allows the storage of electrical power.

ELEMENT -

In a battery, a set of positive and negative plates assembled with separators.

GRID -

A lead alloy framework which holds the active material of a battery plate and conducts the current.

GROUND -

In automotive use, the result of attaching one battery cable to the body or frame which is used as a path for completing a circuit.

HYDROMETER -

A float-type instrument used to determine the state of charge of a battery by measuring the specific gravity of the electrolyte (i.e. the amount of sulfuric acid in the electrolyte).

DIGITAL VOLTMETER -

An instrument that measures the open circuit voltage of a sealed battery.

LOAD TESTER -

An instrument which measures the battery voltage with an electrical load on the battery to determine its overall condition and its ability to perform under actual engine starting conditions.

OPEN CIRCUIT VOLTAGE -

The voltage of a battery with no load. It is 2.1 volts per cell for a conventional battery. The OCV directly corresponds to the state of charge in a battery.

RESERVE CAPACITY RATING -

The power available to run electrical accessories if the alternator fails. It indicates the number of minutes a fully charged battery at 80°F can be discharged at 25 AMPS and not fall below 1.75 volts per cell.

RESISTANCE -

The opposition offered by a substance to the free flow of an electric current.

SHORT CIRCUIT -

A shortening of an electrical path within a battery cell which results in a reduction of cell voltage under load.

SPECIFIC GRAVITY -

The strength or percentage of sulfuric acid in the electrolyte solution.

STATE OF CHARGE -

The amount of electrical power stored in a battery at a given time.

VOLT -

The unit of measure for electrical pressure.

VALVE-REGULATED LEAD-ACID (VRLA) -

A sealed lead-acid battery cell incorporating the use of an internal pressure release valve designed to maintain internal cell pressure. As internal battery or cell pressure reaches and surpasses the valve design limits, the valve will, by design, release momentarily and reseal. Available in Gel and AGM battery types.

BATTERY BEST PRACTICES

How to EXTEND your battery life:

- Keep battery posts clean with a post brush

- Make sure replacement battery equals or exceeds original equipment cranking and reserve capacity specifications

- Remove vent caps and check water level; if water is low, add distilled water to just above plates
- Replace worn or damaged battery cables
- Install anti-corrosion washer

- Use vehicle's original equipment battery hold-down

NOTE:

- WHEN INSTALLING A BATTERY ALWAYS WEAR PROPER EYE, FACE AND HAND PROTECTION.
- INSTALL POSITIVE CABLE TO POSITIVE TERMINAL, THEN NEGATIVE CABLE TO NEGATIVE TERMINAL.
- TIGHTEN CONNECTION; DO NOT HAMMER.
- MAKE SURE THAT CLAMPS AND CONNECTORS DO NOT TOUCH METAL OBJECTS.

What is NOT covered under warranty:

- Damage from overcharging or improper jump starting
- Melted case from vehicle engine fire

- Battery is discharged from defective charging system, lights left on, etc.
- Use of a lower capacity battery than specified as original equipment
- Use of an automotive starting battery in a marine/deep cycle application

- Evidence of freezing

- Hole in the case

- Installation of a battery in reverse polarity or recharging a battery in reverse

A frozen battery is NOT covered under warranty.

- For a battery to freeze, it must be deeply discharged. This happens when:
 - Vehicle is not being used for a long time.
 - Vehicle is used for frequent short trips in very cold weather (alternator does not have enough time to charge the battery in these stop-and-go situations).
 - Accessories, such as CD players, on-board computers, window defrosters, etc., are used at low RPM.
- Vehicle has a defective or inadequate charging system.
